

SortAdapter is a class that implements the Sort interface and has a SortChoose implementation as an attribute named sc. SortAdapter's sort method takes an int array and the size of the array and passes these along with a bool argument of true to it's sc attribute

An implementation of the SortChoose interface would be a sort method that sorts an int array in ascending order if the input @ascending is true and in descending order otherwise.

An implementation of the Sort interface would be a sort method that sorts an int array in ascending order
